Acunetix Security Audit

2025-08-05

Scan of ap.tnnua.edu.tw

Scan details

Scan information	
Start time	2025-08-05T17:00:01.302318+08:00
Start url	https://ap.tnnua.edu.tw/Student/
Host	ap.tnnua.edu.tw
Scan time	4 minutes, 11 seconds
Profile	Full Scan
Responsive	True
Server OS	Windows
Server technologies	ASP.NET,ASP.NET,ASP.NET
Application build	25.4.250417124

Threat level

Acunetix Threat Level 3

One or more high-severity type vulnerabilities have been discovered by the scanner. A malicious user can exploit these vulnerabilities and compromise the backend database and/or deface your website.

Alerts distribution

Total alerts found	8

Alerts details

Insecure Transportation Security Protocol Supported (TLS 1.0)

Severity	High
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The web server supports encryption through TLS 1.0, which was formally deprecated in March 2021 as a result of inherent security issues. In addition, TLS 1.0 is not considered to be "strong cryptography" as defined and required by the PCI Data Security Standard 3.2(.1) when used to protect sensitive information transferred to or from web sites. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.

Impact

An attacker may be able to exploit this problem to conduct man-in-the-middle attacks and decrypt communications between the affected service and clients.

Recommendation

It is recommended to disable TLS 1.0 and replace it with TLS 1.2 or higher.

Affected items

Web Server
Details
The SSL server (port: 443) encrypts traffic using TLSv1.0.
Request headers

HTTP Strict Transport Security (HSTS) Policy Not Enabled

Severity	Medium
Reported by module	/httpdata/HSTS_not_implemented.js

Description

HTTP Strict Transport Security (HSTS) tells a browser that a web site is only accessible using HTTPS. It was detected that your web application doesn't implement HTTP Strict Transport Security (HSTS) as the Strict Transport Security header is missing from the response.

Impact

HSTS can be used to prevent and/or mitigate some types of man-in-the-middle (MitM) attacks

Recommendation

It's recommended to implement HTTP Strict Transport Security (HSTS) into your web application. Consult web references for more information

Connection: Keep-alive

TLS/SSL Weak Cipher Suites

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The remote host supports TLS/SSL cipher suites with weak or insecure properties.

Impact

Recommendation

Reconfigure the affected application to avoid use of weak cipher suites.

Request headers

Cookies Not Marked as Secure

Severity	Low
Reported by module	/RPA/Cookie_Without_Secure.js

Description

One or more cookies does not have the Secure flag set. When a cookie is set with the Secure flag, it instructs the browser that the cookie can only be accessed over secure SSL/TLS channels. This is an important security protection for session cookies.

Impact

Cookies could be sent over unencrypted channels.

Recommendation

If possible, you should set the Secure flag for these cookies.

References

Connection: Keep-alive

ViewsState is not Encrypted

Severity	Low
Reported by module	/RPA/Unencrypted_VIEWSTATE.js

Description

The __VIEWSTATE parameter is not encrypted for one or more pages. To reduce the chance of someone intercepting the information stored in the ViewState, it is good design to encrypt the ViewState.

Impact

Possible sensitive information disclosure.

Recommendation

Turn on the encryption mode for the view state. Consult web references for more information, taking into consideration ASP.NET version

Content Security Policy (CSP) Not Implemented

Severity	Informational
Reported by module	/httpdata/CSP_not_implemented.js

Description

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.

Content Security Policy (CSP) can be implemented by adding a **Content-Security-Policy** header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:

```
Content-Security-Policy:
  default-src 'self';
  script-src 'self' https://code.jquery.com;
```

It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.

Impact

CSP can be used to prevent and/or mitigate attacks that involve content/code injection, such as cross-site scripting/XSS attacks, attacks that require embedding a malicious resource, attacks that involve malicious use of iframes, such as clickjacking attacks, and others.

Recommendation

It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the **Content-Security-Policy** HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.
